DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on March 30, 2010 has been entered.

Allowable Subject Matter

Claims 11-21, 26-36, and 41-42 are allowed.

The following is an examiner's statement of reasons for allowance:

As for **claim 11**, the prior art does not teach or fairly suggest the use of an x-y addressable image sensor comprising a plurality of light receiving elements arranged in an array of rows and columns that convert the light to a signal, means for reading out two or more equivalent samples of a same signal from each light receiving element in at least one row, wherein the same signal is produced after a single integration period for all of the light receiving elements in the at least one row, at least two signal storage banks comprised of individual signal storage elements, each of the at least two storage banks having enough individual storage elements to store the two or more signals from the at least one row of light receiving elements in the array, wherein the two or more samples of the same signal are concurrently stored in different individual signal storage

dements, and at least two select mechanisms which can direct signals from the plurality of light receiving elements to any single or combination of the signal storage banks.

As for **claim 26**, the prior art does not teach or fairly suggest the use of a camera comprising an x-y addressable image sensor comprising a plurality of light receiving elements arranged in an array of rows and columns that convert the light to a signal, means for reading out two or more equivalent samples of a same signal from each light receiving element in at least one row, wherein the same signal is produced after a single integration period for all of the light receiving elements in the at least one row, at least two signal storage banks comprised of individual signal storage elements, each of the at least two storage banks having enough individual storage elements to store the two or more signals from the at least one row of light receiving elements in the array, wherein the two or more samples of the same signal are concurrently stored in different individual signal storage elements, and at least two select mechanisms which can direct signals from the plurality of light receiving elements to any single or combination of the signal storage banks.

As for **claim 41**, the prior art does not teach or fairly suggest the use of a method for operating an x-y addressable image sensor that includes at least two storage banks comprised of individual storage elements each of the at least two storage banks having enough individual storage dements to store signals from at least one row of light receiving elements, the method comprising capturing a single image using a single integration period for all of the light receiving elements in at least one row, after the single integration period, reading out two or more equivalent samples of the same signal

for each light receiving element in the at least one row, storing the two or more samples of the same signal in respective storage elements in the at least two storage banks.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

US007324144B1: note the use of an imaging device that sums multiple samples taken from an imaging array, however, the samples are not equivalent samples taken after a single integration period.

US 20050018064A1: note the use of an imaging array that samples pixels using multiple scanning circuits, wherein each scanning circuit can comprise multiple sub-scanning circuits for outputting the pixel data.
